Version 1.0 | 2026-10-22 | Current

Accessibility Remediation Log

The goal is to meet WCAG 2.1 AA, the standard web accessibility guidelines, so that people using screen readers, magnification, or keyboard-only navigation can use the portfolio. This log keeps adding rows as I check and fix things. "Not yet" means not yet done.

	Item	Problem found	Found on	Why it matters to a reader	Fix	Fixed on	How it was verified
1	Four certificate PDFs	No reading structure, so a screen reader may skip the content	2026-10-22	A blind reader gets nothing from the page	Not yet. Adobe Reader was having issues		
2	Finding aids, Accession Record, Deed of Gift, Records Management Policy, Strategic Plan	No document title saved in the file properties	2026-10-22	A screen reader announces the file name instead of a title	Set a document title on all PDFs and re-exported them as v 1.1.	2026-10-24	Opened each file, clicked properties, description and confirmed the title.
3	Four display photos in the Displays folder; two screenshots in the Audacity folder	No picture descriptions in the README pages	2026-10-22	A blind reader cannot tell what the picture shows	Added plain language description beside each of the four display photos and two Audacity screenshots on their README pages.	2026-10-24	Opened each page on GitHub and checked outline
4	Patron Relations presentation	Each of the slides has a recorded narration	2026-10-22	A person who cannot hear the	Set document title.	2026-10-24	

		with no written version. Speaker icons have no picture descriptions. Some slides use white text on light blue and teal boxes, which is hard ot read.		narration gets nothing from it unless the words are written down. A screen reader cannot tell what an unlabeled icon is. Pale boxes with white text are hard to read for anyone with low vision.	Did not edit narration yet. Planned for week 2026-10-26		
5	Lesson plans and Digitization Guide (Word files)	None of the files has a real heading, only bold text. The Digitization Guide has 16 photos with no descriptions.	2026-10-22	A screen reader user cannot jump between sections	Set the document title and language in all four word files. Added real headings and descriptions for all 16 pictures to the Digitization Guide	2026-10-24	Ran Word's Accessibility Checker on each file; no issues remained
6	README pages	5 pages have no title heading.	2026-10-22	A screen reader user has no outline to navigate.	Added a title heading to the five README pages that had none. Checked all	2026-10-24	Opened each page on GitHub and checked outline

					README pages for skipped heading levels and unclear link names; none found.		
7	Resume PDF	Reading structure and language already set	2026-10-22		None needed	--	--
8	Color contrast across PDFs and Word files	Black on white or ale blue passes	2026-10-22	Low contrast is hard to read	None needed	--	Checked in the file itself

What I each fix matters:

Certificates: A reader who uses a screen reader can now hear each certificate's title, who issued it, and the date, instead of reaching a blank page.

PDF Files: A screen reader now announces each PDF by its real title instead of a file name, so a reader knows what they have opened before they start.

Picture descriptions: A reader who cannot see the photos now hears what each display case and Audacity screen shows, so the pictures are no longer a gap in the evidence.

Presentation (title): A screen reader now announces the presentation by its title instead of a file name.

Presentation (speaker icons): A screen reader now says that each icon is the audio narration for that slide instead of reading an unlabeled picture. *To be fixed.

Presentation (narration): A reader who cannot hear the recordings can follow every slide in writing. *To be fixed.

Word files: A reader who uses a screen reader can jump between the sections of the Digitization Guide and hear what each of its 16 pictures shows, so they can follow the steps without seeing the photos.

README pages: Every page opens with a clear title, so a screen reader user can see the page's outline and move around it without listening from the top.

Resume: A screen reader moves through it top to bottom without skipping anything.

Contrast (slides): Text on slides now stands out from its background, so a reader with low vision can read every box without straining. *To be fixed.

Contrast (Word files): Black text on white or pale blue stays easy to read for readers with low vision.
